Dissemination of initial SIFOR results

On 10th July 2014 the SIFOR project partnership gathered in Bucharest, for a dissemination seminar aimed at local stakeholders. The objective of the event was to **present the initial project outcomes**, the results of the research carried out by UNIMORE and the measures the Regione Emilia Romagna intend to put in place to formalise the profile of “valorizer”, a re-use centre manager.

Some key points include:

- the need to adapt and complement current vocational training qualifications in waste management to also include aspects on preparation for re-use and waste prevention
- significant untapped potential exists to develop markets in the sectors of textile in Italy (collection, sorting and sales)
- In countries such as Romania, where separate collection of waste products and materials is very low, it leaves significant opportunity for social enterprises to partner with municipalities and become active in this field at local level

Re-Use training Programmes in Europe and the findings of the SIFOR project

On September 29th, the partnership of SIFOR moved to Brussels for a dissemination seminar organised by RREUSE. The seminar was the occasion to show to a selected number of participants representing vocational training bodies, social enterprises, reuse centres and local authorities the purpose of the project and to understand better how training activities around the profile of waste manager and "valorizer" could be structured.

In particular key some key training initiatives in Belgium were presented:

Ressources (the Wallonian network of re-use social enterprises) explained the efforts the network is undergoing to see the "valorizer" profile formally adopted by the regional vocational training system. At the moment the skills required for the profile have been clearly identified and now it is up to the FOREM (the competent body) to decide whether the training can be integrated in the formal regional system.

The course, which lasts for 5 weeks, is presently given mainly to staff working in the industry and who are responsible for energy and waste management within the firm. The target here is companies working in specific industrial areas where **synergies can be created to minimise the quantities of waste generated and increase the volume of material susceptible of being re-used and recycled**.

Lastly, specially designed training schemes aimed at the insertion of people with disadvantages in "up-cycling" different materials exist in Flanders, devised by **WEB Turnout**. With the help of designer and architects, trainees are instructed on how to get the maximum from different sort of materials so to re-create new products to be sold in interior design shops.
