

The Last Transnational Meeting of the E-DECOM Project was held in Bilbao.

On 3rd September, the fifth Transnational Meeting of the E-DECOM Project took place in Bilbao, an initiative led by the Foundry Association of the Basque Country and Navarra with the aim of developing e-learning innovative contents as last generation tools to support training methodologies in the Foundry Sector.

The project is funded by the European Commission under the Transfer of Innovation of the Leonardo da Vinci for vocational training and will be developed over the years 2008-2010 coordinated between Spain, Romania, Lithuania, and Greece.

The Way Done

During the two years the project has been developing (2008-2010), the partner organizations of E-DECOM project have stated the different targets until developing an interactive CD with multimedia training content of key competences in the Foundry Sector.

Until reaching this final product, different stages were covered, where various intermediate products on which it's possible to build subsequent results, were developed. Also, the results reached by experts from the partner organizations and other professionals with large experience in competences and technical training, were validated.

The different stages carried out until developing the final product have been the following ones:

- Identification of the main tendencies that affect the Foundry Sector in the future years, according to DIPROCU methodology.
- Detection of the key competences associated to the processes (MAP OF PROCESSES).
- Study and establishment of the references of the key competences.
- Realization and development of four modules in NTIC environment.

All this work carried out, has resulted in an interactive learning CD based on the NTICs for the development of worker's key competences, allowing companies to re-organise themselves and be competitive in the market, taking into account the current changeable context.

Project Clousure

E-DECOM project is closed and a new period begins for the dissemination and valuation of the obtained results.

This new period is considered as an opportunity for the companies in the Foundry Sector to begin to value the benefits of a flexible and adaptable training to the NTICs, contributing at the same time to motivate workers to develop their competences throughout their professional life.

Workers need to be supported and equipped with instruments in order to play a more active rol when managing the development of their competences and requirements for their work.
